

Figure 12. Technical error as a source of nonspecific staining. (A) Section of uterus allowed to dry during immunohistochemical staining with a CD31 antibody. As a result, instead of staining only the endothelium, nonspecific staining was present throughout the section. (B). Tissue not allowed to dry stained with CD31 antibody resulted in a specific staining of endothelial cells (arrows). Epithelium, stroma, and myometrium (asterisks) that serve as internal negative controls are not stained.
