

Timed – mated Female Rats min. of 20 litters/gp; 3 dose grps + control; continuous dosing

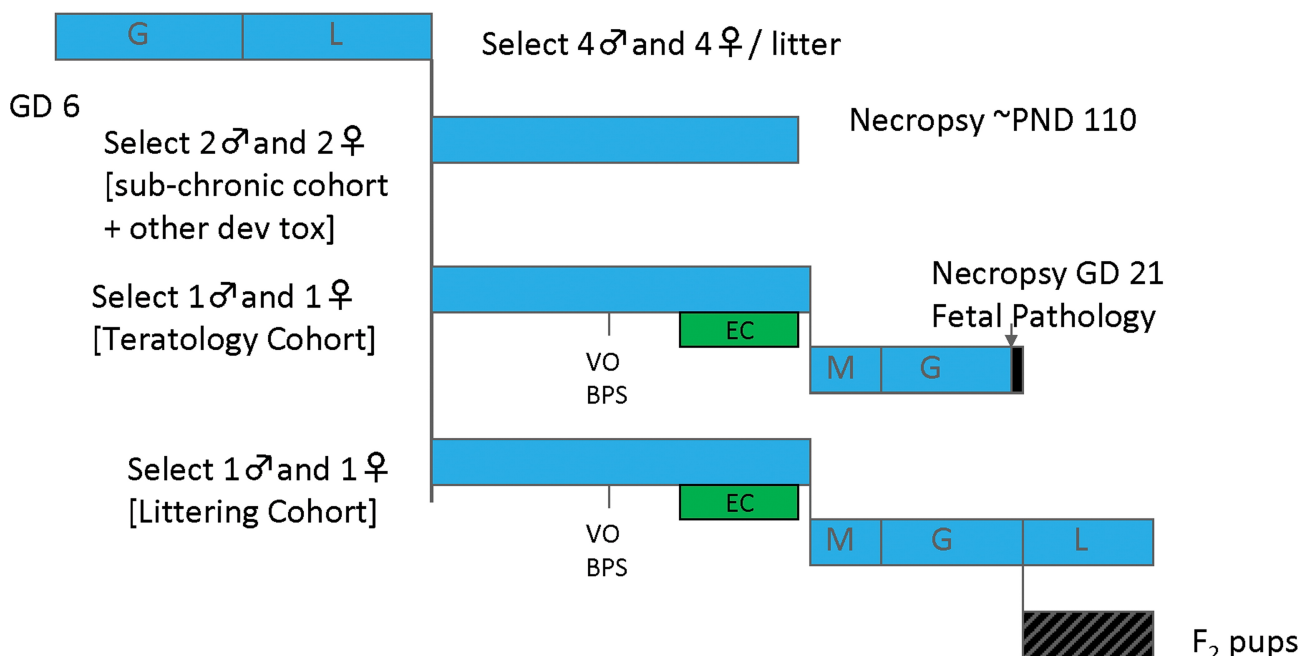

Figure 5. Diagrammatic representation of the National Toxicology Program modified one-generation reproduction study. Only 10 pups per sex (on reaching adulthood) are required for the subchronic cohort, and thus sufficient numbers of animals would be available for evaluations of other developmental toxicity that may include effects on the developing immune or nervous systems (see Figure 6). G = gestation; L = lactation; PND = postnatal day; GD = gestation day; M = mating; VO = vaginal opening; PPS = belanopreputal
