

Figure 2. Uterine cyst from a SD rat. Low-magnification images of a second cyst filled with basophilic flocculent material located beneath the serosa and compressing the outer myometrial layer (A and B). C to F are higher magnifications of the cyst that is lined by flattened to cuboidal epithelium that has moderate eosinophilic cytoplasm and large oval nuclei with 1 to 2 prominent nucleoli. Endometrial cavity is not associated with the cyst (C, H&E). The wall is composed of scant to moderate blue staining of collagen and abundant
