

Figure 3. Uterine cyst in SD rat. Low-magnification images of a third cyst show similar features of the previous cysts in Figures 1 and 2 (A and B). The higher magnification inset in B demonstrates the differences of the tall columnar endometrial epithelium (adjacent to asterisk) and the flattened cuboidal cyst epithelium (arrowhead). C to F are high-magnification images of the cyst and are representative of immunohistochemical staining patterns of the cyst. Brown staining indicates positive reaction to the indicated antibody.
